ABSTRACT

A system regulates access to resources requested by an operation executing on a computer. The operation invokes a plurality of methods that operate upon code during execution. The system includes a policy file, a call stack, and an execution unit. The policy file stores permissions for each of the resources. The permissions authorize particular types of access to the resource based on a source of the code and an executor of the code. The call stack stores representations of the methods and executors in an order of invocation by the operation. The execution unit grants access to the resource when the types of access authorized by the permissions of all of the methods and executors on the call stack encompass the access requested by the operation.

BACKGROUND OF THE INVENTION

The present invention is directed to security measures in a computer system and, more particularly, to systems and methods that control access to a resource based on the source of the code and the identity of the principal on whose behalf the code is being executed.

As the use of computer systems grows, organizations are becoming increasingly reliant upon them. A malfunction in
